TABLE OF CONTENTS

Introduction	1
Design Standards.....	1
Existing Conditions.....	2
Proposed Conditions.....	2
Stormwater Management Summary	2
Calculation summary	3

Introduction

This stormwater management report has been prepared to accompany the submitted plans and stormwater calculations for the proposed redevelopment of Trane Park. The project will consist of a new addition to the existing park shelter, construction of asphalt pavement, concrete driveways, concrete walk, utilities, erosion control, stormwater management, and landscaping. A project location map is provided on Sheet C0-10 in the submitted plan set.

A soils evaluation will be completed by High Cliff Consulting to determine final design infiltration rates according to the requirements of Wisconsin DNR Conservation practice Standard 1002. An NRCS soils report for La Crosse County indicated that soils near the site are of hydrologic soil group A. An infiltration rate of 0.5 in/hr has been assumed for the calculations included in this submittal. The design of the proposed stormwater management will be revised as needed according to the completed soil evaluation

Design Standards

Stormwater management plans and calculations have been prepared to meet the requirements of the City of La Crosse Municipal Code 115-555 (La Crosse County Code Chapter 29) as listed in the table below. The disturbed area for the project is over one acre therefore it will require a Wisconsin DNR WPDES permit and meet the requirements of NR 151 as listed in the table below.

Table 1.1: Design Criteria

	Performance Standard	Requirements
La Crosse County Code of Ordinance Chapter 29	Runoff Control 29.09 (1)	Maintain or reduce peak runoff rates from existing conditions for 10 and 25-year 24 hour design storm events.
	Water Quality 29.09 (2)	Re-development – 60% of load from impervious surfaces other than disconnected rooftops compared to no controls.
	Infiltration 29.09 (3)	Exempt – re-development.
	Thermal Controls 29.09 (4)	N/A – No adjacent cold water streams.
	Protective Areas 29.09 (5)	N/A – No protective areas within proposed site.
	Fueling & Vehicle Maintenance 29.09 (6)	N/A – No proposed fueling or maintenance on site.
Wisconsin Department of Natural Resources NR 151	Total Suspended Solids NR 151.122	Re-development – 40% TSS reduction compared to no controls.
	Peak Discharge NR 151.123	Exempt – re-development.
	Infiltration NR 151.124	Exempt – re-development.
	Protective Areas NR 151.125	N/A – No protective areas within proposed site.
	Fueling & Vehicle Maintenance NR 151.126	N/A – No proposed fueling or maintenance on site.
	Location NR 151.127	BMP's will be located on site.
	Timing NR 151.128	BMP's will be installed prior to final stabilization.

Existing Conditions

The existing site consists of the existing park shelter, asphalt drive, tennis courts, playground, baseball diamond, concrete splash pad, concrete sidewalk, and open park space. The site consists of several separate parcels and City Right-of-Way which will be vacated and parcels combined as part of the project.

The existing site has been separated into 2 watersheds to depict the routing of the runoff from the site as well as run-on from adjacent sites. An existing drainage map showing the drainage areas and land cover can be found in the attachments.

Proposed Conditions

The construction of the proposed site will be separated into two phases. The first phase will consist of a new addition to the existing park shelter along with concrete walk and parking lot. The second phase will consist of multiple areas with playground equipment separated by walking paths and landscaped areas. The proposed site has been separated into 6 watersheds to depict the proposed routing of runoff from the site. It should be noted that runoff from phase II of construction has been included in the proposed stormwater management design. A proposed drainage map showing the drainage areas and land cover can be found in the attachments.

Stormwater Management Summary

Temporary erosion control measures will be implicated for the proposed project prior to the start of construction. Proposed erosion control measures include silt fence, stabilized construction exit, inlet protection, erosion control mat, and a concrete washout area. Locations of the proposed BMPs along with construction activity notes are provided on sheets C1-10 through C1-30 of Appendix A.

Approximate construction sequencing for the project is listed below.

- Install temporary erosion control BMPs
- Stripping topsoil, soil corrections and rough grading
- Footing excavation and construction
- Installation of underground utilities
- Subgrade preparation for parking lot
- Construction of curb and gutter
- Construction of pavement

- Turf restoration and landscaping
- Stabilization and establishment of turf
- Removal of temporary erosion control BMPs

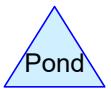

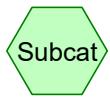

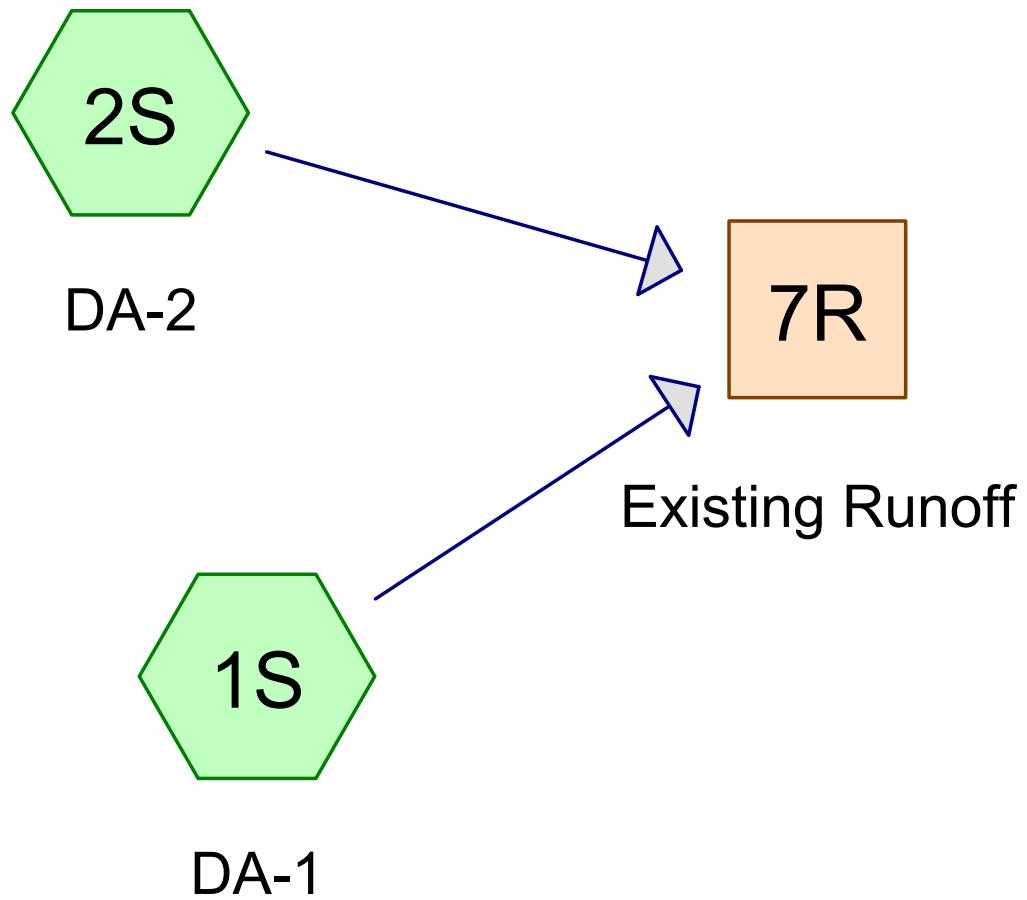

Calculation summary

In conjunction with the plans for the project, calculations were performed for the existing and proposed drainage conditions. Water quantity calculations were completed using hydraulic models developed by utilizing the design data and the HydroCAD Version 10.00-19 computer modeling system. This was used to provide sizing and analysis for the proposed bio-infiltration basin. Hydrographs for existing and proposed scenarios were generated and routed through these models using the Atlas-14 rainfall distribution. The proposed runoff from the analyzed events is provided in the table below. The HydroCAD calculations for the proposed conditions are included in the attachments. It should be noted that drainage area 4 (Phase II) has not been included at this time. The drainage area will be added once final soils information is obtained.

Table 1.2: Site Runoff Calculations

Rainfall Event	Existing Conditions	Proposed Conditions
24-Hour Storm	Peak Flow (CFS)	Peak Flow (CFS)
1-year	0.00	0.02
2-year	0.02	0.04
5-year	0.21	0.13
10-year	0.74	0.26
25-year	2.27	0.49
100-year	6.90	3.27

Water quality calculations will be completed by utilizing the design data and the WinSLAMM Version 10.3.3 computer modeling system. The majority of the runoff from the site is routed to the proposed bio-infiltration basin and infiltrated. Therefore it is estimated that greater than 60% reduction will be achieved for the site.
