### **Scope:**

The Redevelopment Authority has proposed to construct public improvements on the River Point District site by way of a phased approach. Preliminary design work included development of a planned development district document and preliminary street and utility plans. Construction Phase I included placement of fill upon the site to raise the site above the floodplain elevation which is under construction as of May 2021. Construction Phase II will include construction of sanitary sewer, watermain, storm sewer and roadway improvements upon Street A as shown in Exhibit 1.

The Basic Services to be provided by Consultant as set forth herein are provided subject to the attached Standard Terms and Conditions (Service Contracts)(SEH 06.21.19), which is incorporated by reference herein and subject to Exhibits attached to this Agreement. See Exhibit 1 Fee Table.

Phase II (Street A) Design and Bidding Services will include:

#### **1. Storm Water Design.**

- a. Review City, County and State regulations for stormwater runoff for a site draining directly to a major waterway.
- b. A 1D/2D XPSWMM model will be utilized to perform preliminary and final design for the River Point District site to ensure the storm sewer proposed during Phase II accounts for the entire site drainage. Atlas 14 rainfall depths and temporal distributions will be utilized for the study. We will utilize the proposed topographic surface layout from the civil design for the site to prepare a hydrologic and hydraulic model of the proposed storm sewer and stormwater management BMPs for the site. The primary goal of the study is to size the proposed storm sewer system and the recommended stormwater management system (which is proposed to include an underground detention system).
- c. Storm sewer design to include development of a combined hydrologic and hydraulic analysis for the proposed storm sewer drainage system and associated contributing drainage areas. This includes development of a dynamic 1D/2D hydrologic and hydraulic model for the site using XPSWMM to simulate the runoff from the contributing drainage areas and route the flows through the pipes, surface flow areas, and stormwater BMPs for the proposed storm sewer system. Several rainfall events will be simulated, including a design event and two major rainfall events (100-year and 500-year). The storm sewer system will be evaluated under two downstream

tailwater scenarios, a no tailwater influence which will include the Mississippi River at normal pool elevations, and a tailwater impacted design, with the Mississippi River at 10-year water surface elevations.

- d. Detention design to include the evaluation and design of an underground detention system. We have assumed up to three (3) separate alternatives will be developed and analyzed in the XPSWMM model. Figures will be prepared for the selected design events to identify any flood reduction or other benefits associated with the proposed underground detention system projects. This phase also includes the development of conceptual layouts for the alternative projects along with planning level cost estimates and final design of the selected underground detention system. The system will be evaluated under two downstream tailwater scenarios, a no tailwater influence which will include the Mississippi River at normal pool elevations, and a tailwater impacted design, with the Mississippi River at 10-year water surface elevations.
- e. Evaluate proposed underground detention basin utilizing the WinSLAMM model to estimate water quality treatment performance during average annual precipitation.
- f. Prepare stormwater management plan report.
- g. Underground detention basin cast-in-place structural design for two underground detention tanks (preliminarily assumed to be 100'x100'x15' and 300'x50'x15') including:
