

### Runoff calculations

$$Q = D \times A$$

$Q$  = Total runoff 25 yr event  
 $D$  = Direct runoff x Curve No. =  $5.31'' \times .98 = 5.2''$

#### Basin 1

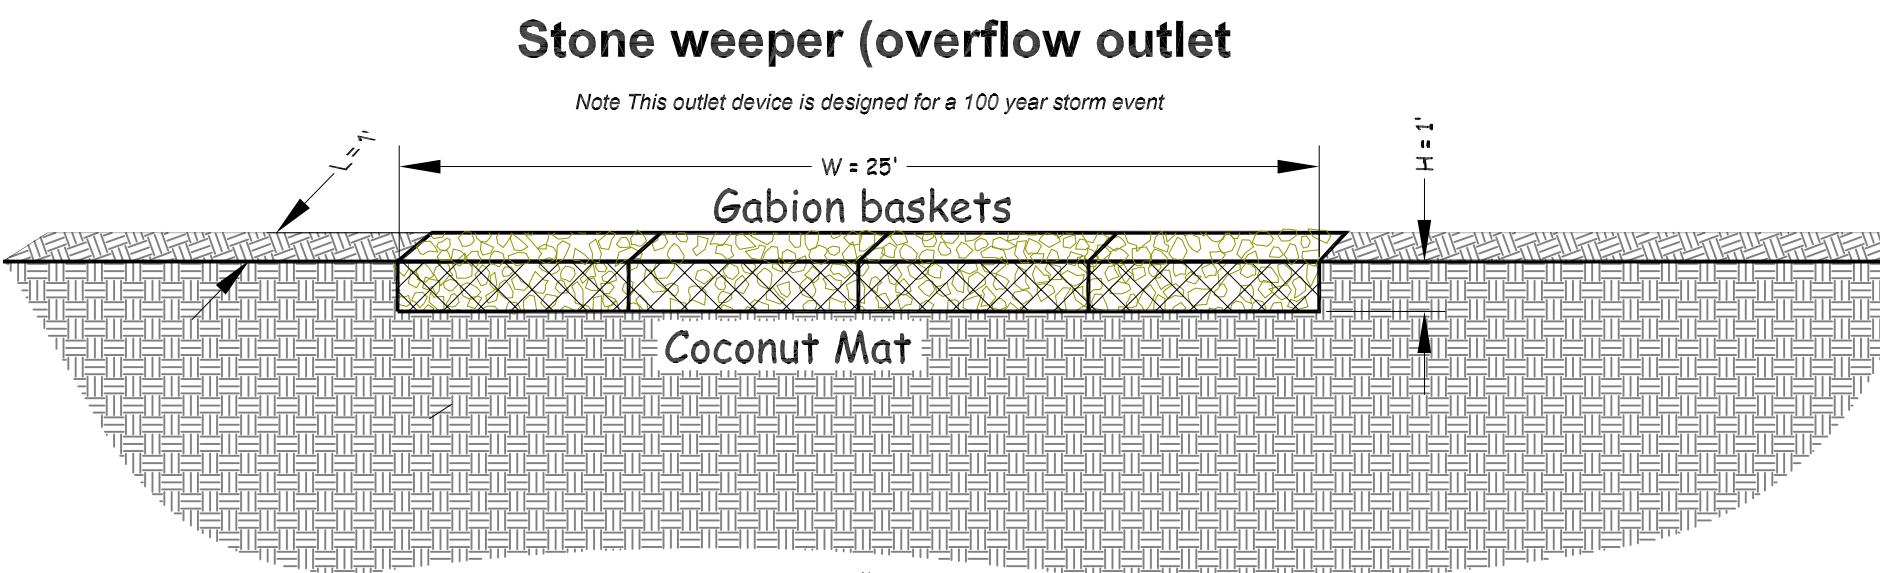

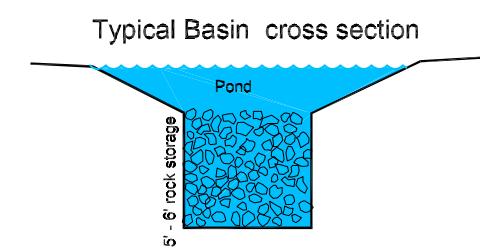

$D = 5.31'' \times .98 = 5.2''$   
 $A$  (Roof and walk) =  $9550 \text{ sq ft}$   
 $Q = 5.20'' \times 9550 \text{ sq ft} = 4138 \text{ cu ft}$

Basin capacity = pond + rock storage  
Pond =  $3018 \text{ cu ft}$   
Rock storage =  $1200 \text{ cu ft}$   
Total storage =  $4218 \text{ cu ft}$

#### Basin 2

$D = 5.31'' \times .98 = 5.2''$   
 $A$  (Road & parking) =  $19,480 \text{ sq ft}$   
 $Q = 5.20'' \times 19480 \text{ sq ft} = 9110 \text{ cu ft}$

Basin capacity = pond + rock storage  
Pond =  $6500 \text{ cu ft}$   
Rock storage =  $3000 \text{ cu ft}$   
Total storage =  $9500 \text{ cu ft}$

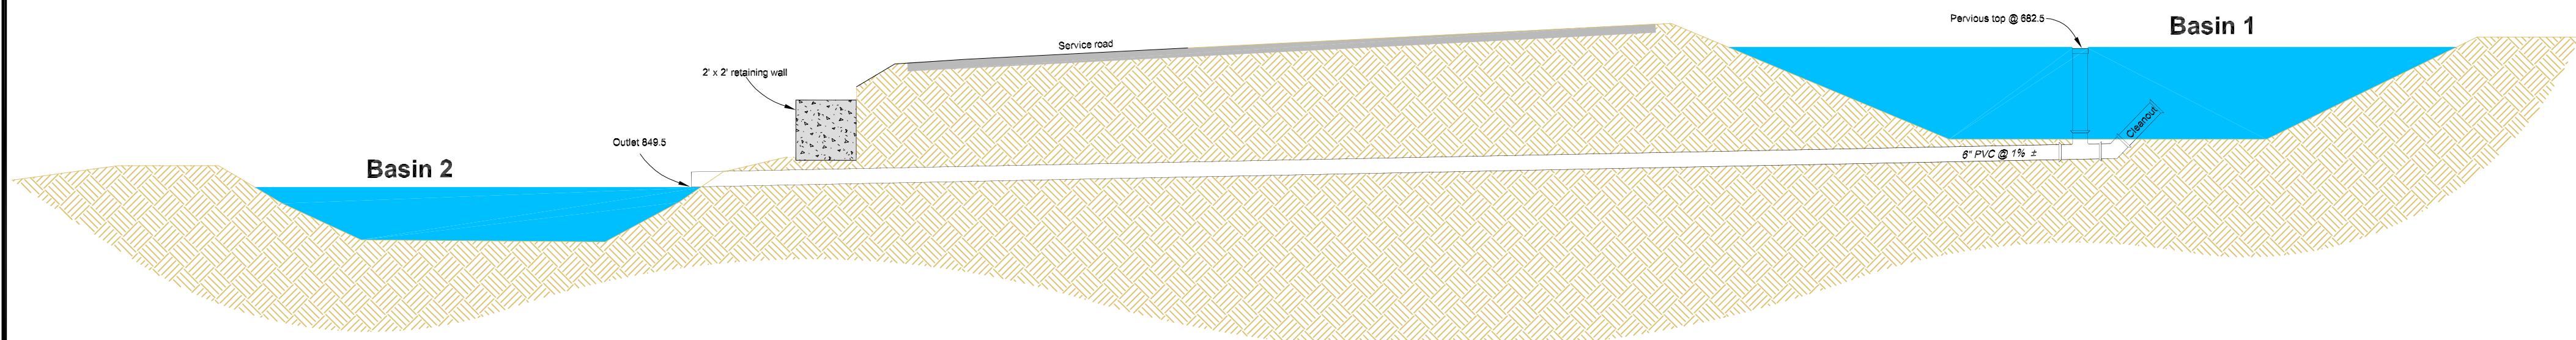

$$Q = \frac{H^{3/2}W}{(L/D + 2.5 + L^2)^{1/2}}$$

$Q$  = Total flow through dam (cfs)  
 $H$  = Ponding depth = 1'  
 $W$  = Total width of weeper = 25'  
 $L$  = Horizontal flow path width = 1.5'  
 $D$  = Average diameter of rock = .5'

$$Q = \frac{1^{3/2} \times 25'}{(1'/.5 + 2.5 + 1^2)^{1/2}} = \frac{1' \times 25'}{(2 + 2.5 + 1)^{1/2}} = \frac{25'}{2.34} = 10.68 \text{ cfs}$$

Existing CFS (100 yr. storm) as per TR-55  
 $11.04 \text{ cfs}$
